

KARL LEHMANN, COPENHAGEN:

DEMONSTRATION OF AN ARTHROPLASTIC SPECIMEN

Demonstration of a prepared specimen of a knee on which arthroplasty with interposition of *Kofferdam* had been carried out 20 weeks before the amputation of the femur.

Histological examination of the specimen shows that the *Kofferdam* agrees very well with the surroundings tissues, as there is formed only a thin layer of granulation tissue with beginning connective tissue formation.

(To be published in detail in a subsequent issue of *Acta orthopædica scandinavica*.)
