

1

2 **Supplemental Figures**

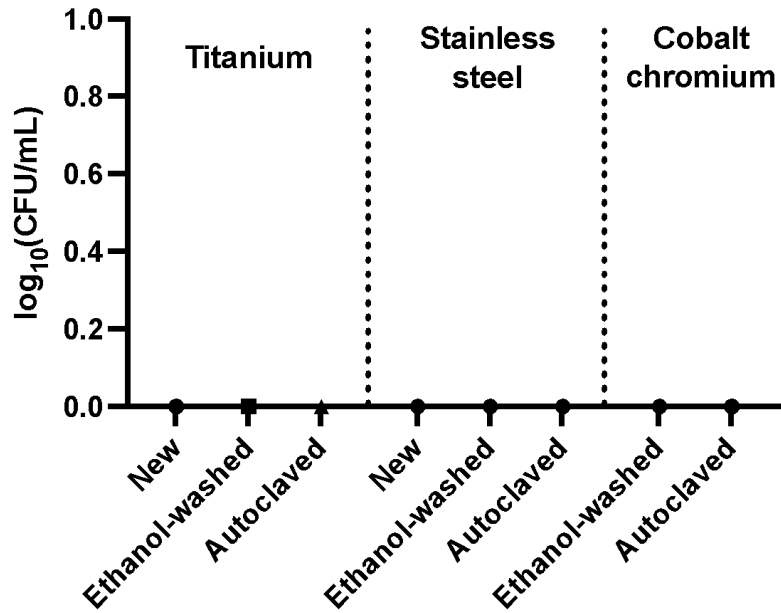

3

4

5 **Figure S1. Crystal violet (CV) staining of *S. aureus* biofilms.** Shown is CV staining of *S.*
6 *aureus* Newman biofilms formed on stainless steel for 24 hours then treated as follows: (A)
7 Untreated control, (B) irrigation with sterile saline, (C) brushing with sonication, (D) brushing
8 with sonication and radiofrequency.

9

10

11 **Figure S2. New and sterilized metals do not have microbial contamination.** Each metal was
 12 tested for contamination at various stages: “new” or fresh from purchased, ethanol-washed and
 13 following autoclaving. Autoclaving served as a control because no viable bacteria would be
 14 expected to be detected post-autoclave treatment. The metals were placed in sterile PBS, then
 15 PBS was plated on sheep blood agar in serial dilutions and grown aerobically for 24h. No growth
 16 was observed for any treatment.

17

A. Titanium

B. Cobalt-chromium

C. Stainless steel

18 **Figure S3. *Staphylococcus aureus* biofilms decrease following treatment with sonication and**
19 **radiofrequency. *S. aureus* Newman was grown for 24 h under static conditions on (A) titanium,**
20 **(B) cobalt-chromium and (C) stainless steel. Following 24 h incubation, the biomass was left**
21 **untreated (Control), irrigated with PBS (Irrigation), or treated by brushing with sonication**
22 **(Sonication) or brushing with sonication with radiofrequency (RF). The remaining biofilm was**
23 **stained with CV, quantified and normalized to the area (mm²) of the respective metal. Three**
24 **biological replicates for each treatment group (performed in triplicate) are plotted, with lines**
25 **connecting each biological replicate across all treatments. Statistical analyses of normalized**
26 **biofilms were performed using Kruskal-Wallis with Dunn’s multiple comparisons with a**
27 **Bonferroni correction.**

28

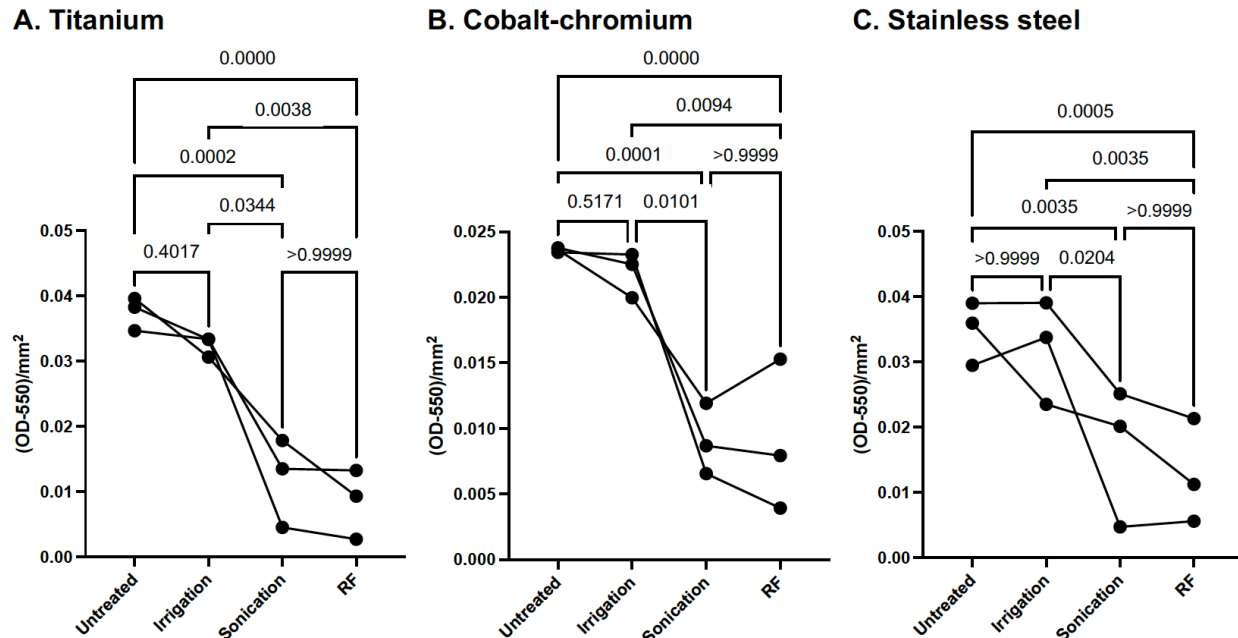

30 **Figure S4. Additional SEM images.** A. Scanning electron microscopy of *S. aureus* Newman
 31 biofilms grown for 24h under static conditions on cobalt-chromium and treated as follows: (A)
 32 untreated control, (B) irrigation with sterile saline, (C) brushing with sonication, or (D) brushing
 33 with sonication with radiofrequency. Shown are selected images at 6,500x, 10,000x and 20,000x
 34 magnifications. The samples were prepared as described in the Materials and Methods. **B.**
 35 Zoomed in view of a portion of the 10,000x magnifications shown in panel A.

37

38 **Figure S5. Crystal violet (CV) staining of *S. epidermidis* biofilms.** Shown is CV staining of *S.*
39 *epidermidis* ATCC R97-03 biofilms formed on stainless steel for 24 hours then treated as
40 follows: (A) Untreated control, (B) irrigation with sterile saline, (C) brushing with sonication,
41 (D) brushing with sonication and radiofrequency.

42

43 **Figure S6. *Staphylococcus epidermidis* biofilms decrease following sonication and**
 44 **radiofrequency across all metals. *S. epidermidis* ATCC R97-03 was grown for 24 h under**
 45 **static conditions on (A) titanium, (B) cobalt-chromium and (C) stainless steel. Following 24 h**
 46 **incubation, the biomass was left untreated (Control), irrigated with PBS (Irrigation), or treated by**
 47 **brushing with sonication (Sonication) or brushing with sonication with radiofrequency (RF). The**
 48 **remaining biofilm was stained with CV, quantified and normalized to the area (mm²) of the**
 49 **respective metal. Three biological replicates for each treatment group (performed in triplicate)**
 50 **are plotted, with lines connecting each biological replicate across all treatments. Statistical**
 51 **analyses of normalized biofilms were performed using Kruskal-Wallis with Dunn's multiple**
 52 **comparisons with a Bonferroni correction.**

53

54

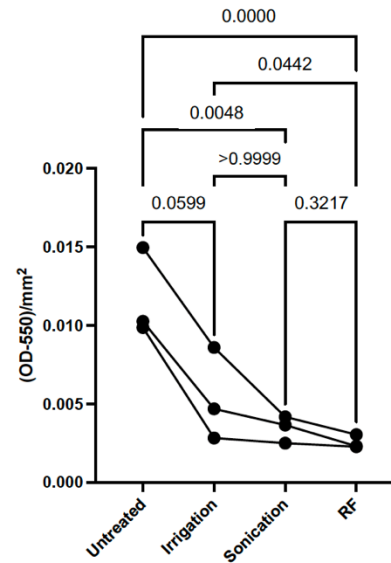

55 **Figure S7. Mechanical treatments reduce *Staphylococcus epidermidis* biofilm burden as**
 56 **assessed by CFUs at 24h.** Colony forming units per milliliter (CFU/mL) are quantified and
 57 normalized by 1 mL volume and surface area (mm²) following each treatment, relative to
 58 untreated (control) for *S. epidermidis* grown on cobalt-chromium for 24h. On cobalt-chromium,
 59 sonication significantly reduces the *S. epidermidis* biofilm burden relative to control and
 60 irrigation, while radiofrequency (RF) significantly reduces the *S. epidermidis* biofilm burden
 61 relative to control. Statistical analysis performed using one-way ANOVA with Tukey's multiple
 62 comparisons.

63

A. Titanium**B. Cobalt-chromium****C. Stainless steel**

64 **Figure S8. *Pseudomonas aeruginosa* biofilms significantly decrease following treatments**
 65 **across metals.** *P. aeruginosa* PA14 was grown for 24 h under static conditions on (A) titanium,
 66 (B) cobalt-chromium and (C) stainless steel. Following 24 h incubation, the biomass was left
 67 untreated (Control), irrigated with PBS (Irrigation), or treated by brushing with sonication
 68 (Sonication) or brushing with sonication with radiofrequency (RF). The remaining biofilm was
 69 stained with CV, quantified and normalized to the area (mm²) of the respective metal. Three
 70 biological replicates for each treatment group (performed in triplicate) are plotted, with lines
 71 connecting each biological replicate across all treatments. Statistical analyses of normalized
 72 biofilms were performed using Kruskal-Wallis with Dunn's multiple comparisons with a
 73 Bonferroni correction.

74

A. Titanium**B. Cobalt-chromium****C. Stainless steel**

75 **Figure S9. *Escherichia coli* biofilms decrease following sonication and radiofrequency**
 76 **treatment in a metal-independent manner.** *E. coli* MG1655 was grown for 24 h under static
 77 conditions on (A) titanium, (B) cobalt-chromium and (C) stainless steel. Following 24 h
 78 incubation, the biomass was left untreated (Control), irrigated with PBS (Irrigation), or treated by
 79 brushing with sonication (Sonication) or brushing with sonication with radiofrequency (RF).
 80 The remaining biofilm was stained with CV, quantified and normalized to the area (mm²) of the
 81 respective metal. Three biological replicates for each treatment group (performed in triplicate)
 82 are plotted, with lines connecting each biological replicate across all treatments. Statistical
 83 analyses of normalized biofilms were performed using Kruskal-Wallis with Dunn's multiple
 84 comparisons with a Bonferroni correction.

85

86

87 **Figure S10. Percent CV-stained biofilm relative to untreated control for all microbes across**
 88 **all metals.** Percent of control (Y-axis) is plotted across each treatment group (X-axis) for *S.*
 89 *aureus* (circle), *S. epidermidis* (square), *P. aeruginosa* (upright triangle), *E. coli* (inverted
 90 triangle). Untreated control values are normalized to 100% and the average normalized OD₅₅₀
 91 value for each microbe on each metal is plotted relative to the untreated control biofilm. Each
 92 point on the plot depicts the average value (of 9 datapoints) per metal, thus there are three points
 93 (titanium, cobalt-chromium, stainless steel) per treatment, per microbe. Annotations represent the
 94 average of each bar for clarity.

95

A. Titanium

B. Cobalt-chromium

C. Stainless steel

96

97 **Figure S11. *Staphylococcus aureus* robust biofilms decrease following sonication and**
98 **radiofrequency across all metals. *S. aureus* Newman was grown for 7 days under static**
99 **conditions, with fresh medium added every 24 h, on (A) titanium, (B) cobalt-chromium and (C)**
100 **stainless steel. Following 7-day incubation, the biomass was left untreated (Control), irrigated with**
101 **PBS (Irrigation), or treated by brushing with sonication (Sonication) or brushing with sonication**
102 **with radiofrequency (RF). The remaining biofilm was stained with CV, quantified and normalized**
103 **to the area (mm²) of the respective metal. Three biological replicates for each treatment group**
104 **(performed in triplicate) are plotted, with lines connecting each biological replicate across all**
105 **treatments. Statistical analyses of normalized biofilms were performed using Kruskal-Wallis with**
106 **Dunn's multiple comparisons with a Bonferroni correction.**
